

Programming the LoRaTracker HAB

To program the LoRaTracker HAB board you will need to set-up the Arduino IDE for a 3.3V 8Mhz Pro Mini, see below;

You will also need to install the following libraries;

The TinyGPS++ library;

<http://arduiniana.org/libraries/tinygpsplus/>

The Flash library;

<http://arduiniana.org/libraries/flash/>

The LowPower Library;

<https://github.com/rockscream/Low-Power/tree/master>

The rest of the library files should be part of an up to date Arduino IDE install.
